The Carbon Cycle Game
A Classroom Activity for Ocean Gazing Episode #16: Antarctica melting

Written by: Kate Florio, Katie Gardner, Liberty Science Center

Grade Level: 8-12
Lesson Time: 20-45 min

Materials Required
Carbon Cycle Game Dice (Color or black and white), Scissors, Scrap paper (optional but recommended), Tape, String or lanyard (at least an 8” length per student), Pony beads (white, light blue, dark blue, light green, pink, dark green, orange, purple, grey, and brown; if not necessarily these, you will need 10 distinctly different colors), Cups (at least one for each station), Carbon reservoir Station Markers (Color or black and white), Carbon Cycle Game Worksheet (1 per student), Pencils or pens, Unopened undisturbed bottle of seltzer or clear soda (optional)

Summary
Students will take on the role of a carbon atom and record which reservoirs in the carbon cycle they visit. They will compare and contrast their trip with those of their classmates to discover information about sources and sinks, and residence times of the different reservoirs. Ocean processes are highlighted to allow the educator to define the biological pump and explain its importance to climate.

Objectives
✓ Model the movement of carbon through different reservoirs.
✓ Compare and contrast fast and slow processes (short and long residence times) that move carbon.
✓ Understand that the path taken by an atom through a biogeochemical cycle is complex, not a circle, and provide an example of conservation of matter.
✓ Put processes such as photosynthesis and respiration in the larger context of biogeochemical cycling.

Introduction
Understanding the sources and sinks of atmospheric carbon dioxide is necessary to understanding the causes and consequences of climate change. The carbon cycle is complex, with many reservoirs both living and nonliving, each with a number of sources and sinks. To put the carbon cycle in the context of understanding climate change and the issues scientists are concerned with, we focus on the sinks of atmospheric carbon dioxide, and the fate of the carbon after it is removed from the atmosphere. As people burn fossil fuels for energy, large amounts of carbon dioxide are released into the atmosphere. This introduces a large source of both carbon, and a greenhouse gas. Scientists interested
in the long term effects and possible outcomes of this source of greenhouse gas are interested in sinks that not only remove carbon dioxide from the atmosphere, but provide a source of carbon to a reservoir with a long residence time. Understanding the connections between reservoirs, and the interaction between long and short residence times, is very helpful in understanding ongoing scientific research and its importance to concerns about climate change.

Data Activity

A. Preparation
1. Print out the Carbon Cycle Game Dice (color or black and white, your choice). It is helpful, but not necessary, to have more than one die for each station.
2. Cut out the dice and crease along the lines between the faces.
3. Tape the open edges together to make a cube. It is helpful to weight the dice with a ball of scrap paper about the same size as the finished cube. Filled dice roll more easily than empty ones.
4. Print out the Station Markers (color or black and white).
5. Set up each station in a different location around the room. Each station should have:
   a. At least one die. (Duplicates are especially helpful for the Atmosphere and Surface Ocean stations; students will visit these often, and not having to wait in line to roll dice will make gameplay faster.)
   b. A station marker posted where students can easily see it once moving around the room.
   c. A cup filled with the corresponding color of beads.
   d. A cup filled with the corresponding color of beads.
6. Cut lengths of string or lanyard for each student and knot one end.

II. Activity
1. Review with students why carbon is so important (to biology, and climate).
2. Tell students they are going to pretend to be a carbon atom moving through the carbon cycle. Review the water cycle as a familiar concept, and introduce terms such as reservoir, source, and sink using the water cycle as an example.
3. Go over what reservoirs will be included in the carbon cycle game. Note for students that there are many other reservoirs we are not including, such as fossil fuels.
4. Review the rules of the game:
   a. Students will keep track of their journey by adding a bead to their string to represent each reservoir they visit.
   b. Students should add a bead first, so they don't forget, then roll the dice.
   c. Students should read the dice carefully for information about the process that is moving them from one reservoir to another, and then go to their next station as instructed by the dice.
   d. If a die tells them to stay in place for a turn, they should add another bead of that color before re-rolling.
   e. As students represent carbon, an element, they don’t “want” to go to any particular place. There is no “goal” they are trying to get to and they should go where the dice take them. Each turn they should roll the appropriate die ONCE, and whatever it says is
what they do. (Monitor students during game play to make sure they are not cheating, i.e. “I wanted a _____ bead!”)
f. Students should continue moving through the cycle until they have fifteen beads on their string.

5. Give students their starting location. The carbon cycle is a large and complex topic, so how you distribute them is up to whatever connections you would like to make during the discussion portion.
   a. If you would primarily like to discuss residence time, start a couple groups of students in the atmosphere and surface ocean, and a couple in the sediments and deep ocean dissolved reservoirs. This is where it is helpful to have duplicate dice for some stations – if you would like eight students to start in the atmosphere, you may want to make at least eight atmosphere dice.
   b. For the biological pump, start all students in the atmosphere and surface ocean. Be sure you don’t let any students begin in deep ocean particles or ocean sediments.
   c. Once students get the hang of it, the game goes quickly, so if you have enough materials you can certainly run the game more than once, with a slightly different focus each time.
6. Monitor students as they move through the cycle and remind them of the rules if needed.
7. When students have finished their cycle, pass out worksheets and have them decode their string of beads back to which reservoirs they represent.
8. Have students compare their cycle to their neighbors.’
9. Use the diagram to represent the journey through the cycle as a series of arrows. Is a cycle a circle?
10. Discuss the journeys students took. Possible discussion topics include:
   a. Overall, which reservoirs did students visit the most?
   b. Which reservoirs have long residence times? Which have short residence times?
   c. What are the processes that move carbon from one reservoir to another? (Choose a few to highlight.) Use the seltzer or soda to discuss carbon dioxide moving between air and water. Initially many students will use the terms “evaporation” and “condensation” when you ask them how carbon moves from one to the other; remind them that those are terms for the water cycle and for changes in state of matter. The soda is helpful both to show that air and gas dissolves in water in the same way that solutes such as salt do, and to help them connect to the short residence time of gas in liquid (“If I open this and leave it here overnight, will it still be fizzy tomorrow?”).
   d. What processes move carbon from the atmosphere to the ocean sediments? Define the biological pump for students. The biological pump is the set of processes in the ocean that sequester carbon
(make it unavailable to be recycled back into the atmosphere for a long period of time).

Identify if any students were sequestered (Atmosphere – Surface Ocean – Ocean Plants – Deep Particles – Ocean Sediments. Can also stop at Ocean Consumers between plants and particles).

Scientists are interested in areas of the ocean with a very efficient biological pump, as well as areas of the ocean where the biological pump is either less efficient than expected, or decreasing in efficiency.

Higher level students can research iron fertilization experiments and make connections back to these concepts.

e. Have students brainstorm what reservoirs and processes have not been included in the game (soils, fossil fuels, sedimentary rocks; burning of fossil fuels, subduction of sediment and volcanic eruptions for a few examples).

As an extension, have students make dice to try and represent the sources and sinks for these reservoirs, and their fluxes and residence times. This requires students to understand that a) each face of a die represents a sink from that reservoir, b) the larger the flux for a particular sink, the more faces of the die are assigned to it, and c) the longer the residence time the more “roll this station again” faces a die needs.

Extension

For upper level students who are spending more time studying biogeochemical cycles, challenge students to adapt the game for another element, such as nitrogen. Students can decide which reservoirs to include and how to represent the sources, sinks, fluxes, and residence times by varying the dice. They can play their created game to see how well they represented the cycle.

Optional: If you don’t have the materials to have the students use beads/make bracelets to record their journey, you may use a simple worksheet to have them keep track of their journey as they go.

Reference

Helping students understand conservation of matter (in this case, carbon) in processes like photosynthesis and the carbon cycle as a whole is essential to their understanding of environmental issues surrounding clean energy and climate change.

ATMOSPHERE
SURFACE OCEAN
OCEAN PLANTS
OCEAN CONSUMERS
DEEP PARTICLES
OCEAN SEDIMENTS
LAND PLANTS
LAND CONSUMERS
FRESH WATER
DEEP DISSOLVED
ATMOSPHERE dice (white)

LAND PLANTS
You are carbon in the form of CO₂.
You are taken up by the plant for photosynthesis.
Go to LAND PLANTS.

ATMOSPHERE
You are carbon in the form of CO₂.
You stay in the atmosphere.
Roll ATMOSPHERE again.

FRESH WATER
You are carbon in the form of CO₂.
You dissolve in water.
Go to FRESH WATER.

SURFACE OCEAN
You are carbon in the form of CO₂.
You dissolve in water.
Go to SURFACE OCEAN.

SURFACE OCEAN
You are carbon in the form of CO₂.
You dissolve in water.
Go to SURFACE OCEAN.
Go to SURFACE OCEAN.

SURFACE OCEAN
You are carbon in the form of CO₂.
You dissolve in water.
Go to SURFACE OCEAN.

SURFACE OCEAN
You are carbon in the form of CO₂.
You dissolve in water.
Go to SURFACE OCEAN.
OCEAN PLANTS
You are carbon in the form of CO$_2$.
You are taken up by the plant for photosynthesis.
Go to OCEAN PLANTS.

SURFACE OCEAN
You are dissolved carbon.
You are stored in the ocean.
Roll SURFACE OCEAN again.

ATMOSPHERE
You are dissolved carbon.
You are released into the atmosphere as CO$_2$.
Go to ATMOSPHERE.

OCEAN PLANTS
You are carbon in the form of CO$_2$.
You are taken up by the plant for photosynthesis.
Go to OCEAN PLANTS.

ATMOSPHERE
You are dissolved carbon.
You are released into the atmosphere as CO$_2$.
Go to ATMOSPHERE.
OCEAN PLANTS (light green)

OCEAN CONSUMERS
You are carbohydrate in the plant which has been eaten by an animal.
Go to OCEAN CONSUMERS.

DEEP PARTICLES
You are carbohydrate in a plant that has died. The dead plant sinks, carrying you into the deep ocean.
Go to DEEP PARTICLES.

SURFACE OCEAN
You are carbohydrate in the plant, respired to provide energy. You are released into the surrounding water as CO$_2$.
Go to SURFACE OCEAN.

OCEAN CONSUMERS
You are carbohydrate in the plant which has been eaten by an animal.
Go to OCEAN CONSUMERS.

SURFACE OCEAN
You are carbohydrate in the plant, respired to provide energy. You are released into the surrounding water as CO$_2$.
Go to SURFACE OCEAN.

OCEAN PLANTS
You are carbohydrate being stored in the plant, or used to grow more plants.
Roll OCEAN PLANTS again.
OCEAN CONSUMERS dice (pink)

SURFACE OCEAN
You are carbohydrate the animal ate, respired to provide energy.
You are released into the surrounding water as CO\textsubscript{2}.

Go to SURFACE OCEAN.

DEEP PARTICLES
You are carbon in animal waste, or the body of an animal that has died. The waste/dead animal sinks, carrying you into the deep ocean.

Go to DEEP PARTICLES.

SURFACE OCEAN
You are carbohydrate the animal ate, respired to provide energy.
You are released into the surrounding water as CO\textsubscript{2}.

Go to SURFACE OCEAN.

OCEAN CONSUMERS
The animal you were part of was eaten by another animal. Stay in consumers.

Roll OCEAN CONSUMERS again.

SURFACE OCEAN
You are carbohydrate the animal ate, respired to provide energy.
You are released into the surrounding water as CO\textsubscript{2}.

Go to SURFACE OCEAN.

OCEAN CONSUMERS
You are carbon stored in the body of an animal. Stay in consumers

Roll OCEAN CONSUMERS again.
DEEP PARTYCLES dice (grey)

DEEP DISSOLVED
You are carbon in waste, respired by bacteria to provide energy.
You are released into the surrounding water as CO₂.
Go to DEEP DISSOLVED.

DEEP DISSOLVED
You are carbon in waste, respired by bacteria to provide energy.
You are released into the surrounding water as CO₂.
Go to DEEP DISSOLVED.

DEEP DISSOLVED
You are carbon in waste or dead stuff. The particle sinks, carrying you to the sediment on the seafloor.
Go to OCEAN SEDIMENTS.

DEEP DISSOLVED
You are carbon in waste or dead stuff. The particle sinks, carrying you to the sediment on the seafloor.
Go to OCEAN SEDIMENTS.

DEEP DISSOLVED
You are carbon in waste or dead stuff. The particle sinks, carrying you to the sediment on the seafloor.
Go to DEEP DISSOLVED.
OCEAN SEDIMENTS dice (brown)

You are carbon in dead plants and animals. You are covered by sediments and buried.

Roll OCEAN SEDIMENTS again.

You are carbon in dead plants and animals. You are covered by sediments and buried.

Roll OCEAN SEDIMENTS again.

You are carbon in the top layer of the sediments. You are respired by bacteria to provide energy and released into the surrounding water as CO₂. Go to DEEP DISSOLVED.

DEEP DISSOLVED

You are carbon in dead plants and animals. You are covered by sediments and buried.

Roll OCEAN SEDIMENTS again.

You are carbon in dead plants and animals. You are covered by sediments and buried.

Roll OCEAN SEDIMENTS again.

You are carbon in dead plants and animals. You are covered by sediments and buried.

Roll OCEAN SEDIMENTS again.
LAND PLANTS dice
(dark green)

LAND PLANTS
You are carbohydrate being stored in the plant, or used to grow more plants.
Roll LAND PLANTS again.

FRESH WATER
You are in plant matter that has washed into a stream or lake.
Go to FRESH WATER.

ATMOSPHERE
You are carbohydrate in the plant, respired to provide energy.
You are released into atmosphere as CO₂.
Go to ATMOSPHERE.

LAND CONSUMERS
You are carbohydrate in the plant which has been eaten by an animal.
Go to LAND CONSUMERS.

ATMOSPHERE
You are carbohydrate in the plant, respired to provide energy.
You are released into atmosphere as CO₂.
Go to ATMOSPHERE.

LAND CONSUMERS
You are carbohydrate in the plant which has been eaten by an animal.
Go to LAND CONSUMERS.
LAND CONSUMERS dice (orange)

ATMOSPHERE
You are carbohydrate the animal ate, respired to provide energy. You are released into the atmosphere as CO₂.

Go to ATMOSPHERE.

ATMOSPHERE
You are carbohydrate the animal ate, respired to provide energy. You are released into the atmosphere as CO₂.

Go to ATMOSPHERE.

FRESH WATER
You are carbon in animal waste that has washed into a stream or lake.

Go to FRESH WATER.

LAND CONSUMERS
The animal you were part of was eaten by another animal. Stay in consumers.

Roll LAND CONSUMERS again.

LAND CONSUMERS
You are carbon stored in the body of an animal. Stay in consumers

Roll LAND CONSUMERS again.
LAND PLANTS
You are carbon in the form of CO2. You are taken up by the plant for photosynthesis.
Go to LAND PLANTS.

ATMOSPHERE
You are dissolved carbon. You are released into the atmosphere as CO2.
Go to ATMOSPHERE.

ATMOSPHERE
You are dissolved carbon. You are released into the atmosphere as CO2.
Go to ATMOSPHERE.

SURFACE OCEAN
You are dissolved carbon. Rain, freshwater runoff, or a river carries you to the ocean.
Go to SURFACE OCEAN.

SURFACE OCEAN
You are dissolved carbon. Rain, freshwater runoff, or a river carries you to the ocean.
Go to SURFACE OCEAN.

FRESH WATER
You are dissolved carbon. You are stored in a lake or river.
Roll FRESH WATER again.
Carbon Cycle Game

Record your journey as you move through the stations. Where did your carbon atom go?

**Carbon pool**
